

Feedback Comment Bank

Write the **code** on the paper, or paste the full comment into your LMS. Every comment ends with the fix.

Loops (L)

Code	Comment
L1	Off-by-one: for a String, use <code>i < s.length()</code> , not <code><=</code> — the last valid index is <code>length()-1</code> .
L2	Independent nested loops multiply (outer \times inner). You added them. Recount.
L3	Infinite loop — your loop variable never changes toward the exit condition. Update it inside the loop.

Traversal (T)

Code	Comment
T1	You start the traversal at index 1, skipping the first character. Start at 0.
T2	<code>charAt</code> is called with an index that can equal <code>length()</code> — that throws <code>StringIndexOutOfBoundsException</code> . Tighten the bound.

Positive (G)

Code	Comment
G1	Correct bounds (<code>i < length()</code>) and every character processed. That's the exact FRQ pattern.
G2	Accurate nested-loop count — you multiplied correctly and tracked the accumulator. Strong.
